## 4th Slide Set Cloud Computing

Prof. Dr. Christian Baun

Frankfurt University of Applied Sciences  
(1971–2014: Fachhochschule Frankfurt am Main)  
Faculty of Computer Science and Engineering  
[christianbaun@fb2.fra-uas.de](mailto:christianbaun@fb2.fra-uas.de)

# Agenda for Today

- Amazon Web Services (AWS)
  - Reasons for using the AWS
  - Examples of applications that use the AWS
  - Elastic Compute Cloud (EC2)
  - Elastic Block Store (EBS)
  - Elastic Load Balancing (ELB)
  - Simple Storage Service (S3)
  - Google Cloud Storage and further alternative service offerings

# Amazon Web Services (AWS)

- The AWS is a collection of different public cloud services
  - Launched in 2002
  - Billed according to consumption
  - Services of the AWS are among others...

Elastic Compute Cloud (EC2)	⇒ Infrastructure service for virtual servers
Simple Storage Service (S3)	⇒ Storage service for web objects
Elastic Block Store (EBS)	⇒ Storage service for virtual storage volumes
Elastic Load Balancing (ELB)	⇒ Service for virtual load balancers
CloudWatch	⇒ Service for monitoring AWS resources
Auto Scaling	⇒ Service for scaling EC2 capacities
SimpleDB	⇒ Service for distributed database
Amazon Simple Queue Service (SQS)	⇒ Service for message queues
Amazon Mechanical Turk	⇒ HuaaS/Crowdsourcing marketplace

## Attention!

- Many screenshots in this slide set are from the years 2012/2013/2014
- The web interfaces of cloud service providers often change
- ⇒ Many screenshots are outdated! Sorry for that!
- The functionality and technical terms are seldom modified

AWS Overview – <http://aws.amazon.com>

**Cloud**  
Amazon V analytics, These ser enterprise application

---

**Compute**

- Amazon EC2
- Amazon EC2 Auto Scaling
- Amazon Elastic Container Service
- Amazon Elastic Container Service for Kubernetes
- Amazon Elastic Container Registry
- Amazon Lightsail
- AWS Batch
- AWS Elastic Beanstalk
- AWS Fargate
- AWS Lambda
- AWS Serverless Application Repository
- Elastic Load Balancing
- VHware Cloud on AWS

---

**Storage**

- Amazon Simple Storage Service (S3)
- Amazon Elastic Block Storage (EBS)
- Amazon Elastic File System (EFS)
- Amazon Glacier
- AWS Storage Gateway
- AWS Snowball
- AWS Snowball Edge
- AWS Snowmobile

---

**Database**

- Amazon Aurora
- Amazon RDS
- Amazon DynamoDB
- Amazon ElastiCache
- Amazon Redshift
- Amazon Neptune
- AWS Database Migration Service

---

**Migration**

- AWS Migration Hub

**AR & VR**

- Amazon Sumerian

---

**Application Integration**

- Amazon MQ
- Amazon Simple Queue Service (SQS)
- Amazon Simple Notification Service (SNS)
- AWS AppSync
- AWS Step Functions

---

**Customer Engagement**

- Amazon Connect
- Amazon Pinpoint
- Amazon Simple Email Service (SES)

---

**Business Productivity**

- Alexa for Business
- Amazon Chime
- Amazon WorkDocs
- Amazon WorkMail

---

**Desktop & App Streaming**

- Amazon WorkSpaces
- Amazon AppStream 2.0

---

**Internet of Things**

- AWS IoT Core
- Amazon FreeRTOS
- AWS Greengrass
- AWS IoT 1-Click
- AWS IoT Analytics
- AWS IoT Button
- AWS IoT Device Defender
- AWS IoT Device Management

---

**Game Development**

- Amazon GameLift
- Amazon Lumberyard

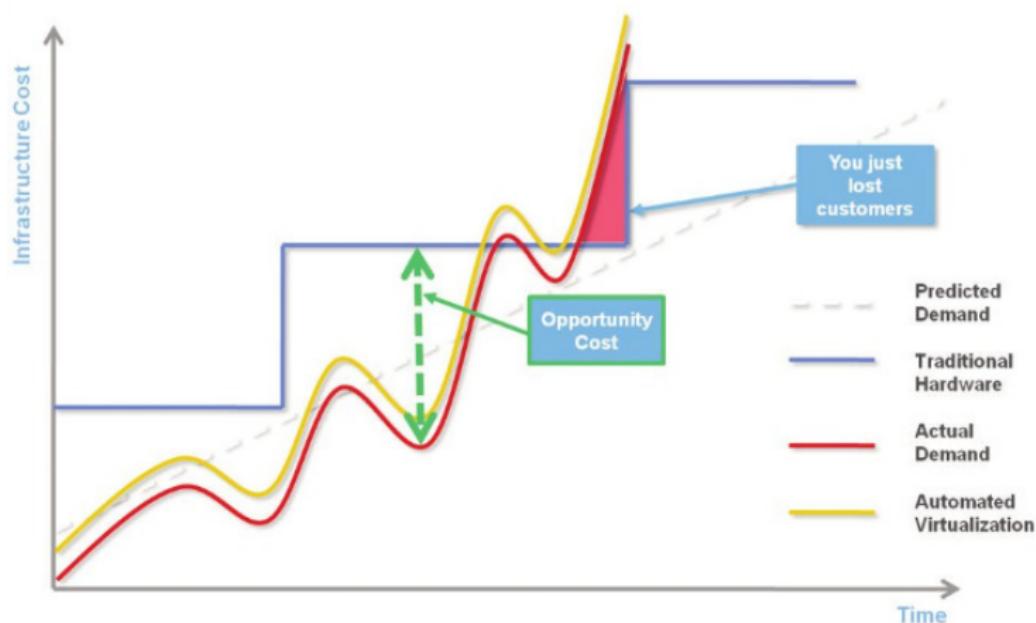

## Why AWS?

- Why should a company use the AWS, instead of buying own resources?
  - How many resources does the company need in the future?
  - Scenario: A web offering of a startup company
    - How many resources will be consumed?
    - What costs will arise?
    - How much time is required to acquire additional resources and include them into the infrastructure?

Without a credit card, the AWS cannot be used

Own physical Infrastructure compared with the Cloud

## **Take the Risk Factor out of Capacity Planning**

Source: Amazon Web Services

## AWS Customer Success Story: Animoto (1/2)

- Users can create videos from their own pictures and music
    - <http://animoto.com>
  - The software analyzes the pictures and the music and generates videos in the style of a trailer or a MTV music video
  - Videos can be uploaded to YouTube and exported to various formats

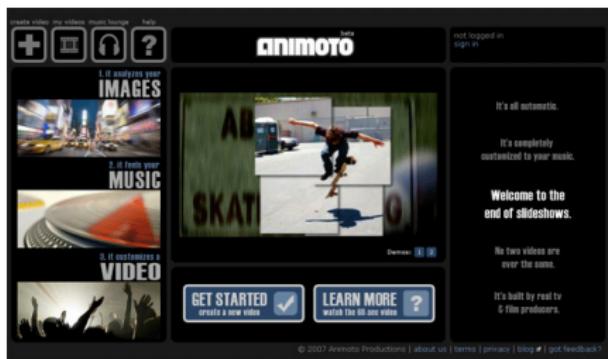

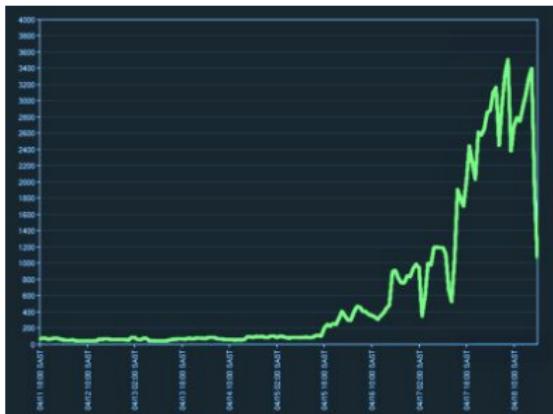

Image source: Google image search

AWS Customer Success Story: Animoto (2/2)

- 2006-2008: Only few users used the service
  - April 2008: Facebook application launched
    - 750,000 new users in 3 days
    - At the peak, up to 25,000 people tried to render a video in a single hour
    - Slashdot effect!
    - Automatic adjustment of the instances to render the videos from 2 up to 450

<http://www.youtube.com/watch?v=VwDS6MexKEo>

## Slashdot effect

From Wikipedia, the free encyclopedia

"*Flash crowd*" redirects here. For the short story by Larry Niven, see [Flash Crowd](#). For the social gathering in the real world, see [flash mob](#).

The **Slashdot effect**, also known as **slashdotting**, occurs when a popular [website](#) links to a smaller site, causing a massive increase in traffic. This [overloads](#) the smaller site, causing it to slow down or even temporarily become unavailable. The name stems from the huge influx of [web traffic](#) that would result from the technology news site [Slashdot](#) linking to websites, although the name is dated since flash crowds from *Slashdot* have been reported in 2005 as diminishing beginning in 2004 due to competition from [similar sites](#).<sup>[1]</sup> The effect has been associated with other websites or metablogs such as [Fark](#), [Digg](#), [Drudge Report](#), [Reddit](#), and [Twitter](#), leading to terms such as being [Farked](#) or [Drudged](#), or being under the [Reddit effect](#).<sup>[2][3]</sup> Google Doodles, which link to search results on the doodle topic, also result in high increases of traffic from the search results page.<sup>[4]</sup> Typically, less robust sites are unable to cope with the huge increase in traffic and become unavailable – common causes are lack of sufficient [data bandwidth](#), [servers](#) that fail to cope with the high number of requests, and traffic [quotas](#). Sites that are maintained on shared hosting services often fail when confronted with the Slashdot effect.

A **flash crowd** is a more generic term without using any specific name that describes a network phenomenon where a network or host suddenly receives a lot of traffic. This is sometimes due to the appearance of a web site on a blog or news column.<sup>[5][6][7]</sup>

- Linear increase of traffic is unrealistic
- Huge problem for startup companies with own resources

## AWS Customer Success Story: New York Times

- 2007: The New York Times wants to create PDF versions from the articles from the years 1851-1980
  - The newspaper planned to make the articles from the years 1851-1922 available online for free
- The raw version of the articles were 11 million scanned images
  - Each article had to be composed of several TIFF files and had to be scaled
- First, 4 TB TIFF files had to be uploaded to S3
- 100 EC2 instances required approximately 24 hours for the calculation
- Result: 1.5 TB of PDF files inside S3
- <https://timesmachine.nytimes.com>

<https://aws.amazon.com/de/blogs/aws/new-york-times/>

<http://open.blogs.nytimes.com/2007/11/01/self-service-prorated-super-computing-fun/>

1:08 PM - 20 Apr 12 - [End this Thread](#)

reddit on AWS - Customer Success Story

- 2012: reddit has 4 billion page views per month
  - Scalable infrastructure based of AWS
- Server capacity was doubled in minutes for President Obama's live Q&A session in 2012

<http://www.youtube.com/watch?v=BPMNB29zDvk>

Update (May 2018): The video is not online any more...

# AWS Credits – <https://aws.amazon.com/education/awseducate/>

The screenshot shows the AWS Educate landing page. At the top, there's a navigation bar with the AWS logo, a search bar containing the URL, and links for 'Menu', 'English', 'My Account', and 'Sign Up'. Below the navigation, there are three main sections:

- Institutions**: Features an icon of a classical building and describes it as providing resources for cloud-related learning to students and educators at member institutions.
- Educators**: Features an icon of an open book and describes it as providing access to AWS technology, open source content, training resources, and a community of cloud evangelists.
- Students**: Features an icon of a graduation cap and describes it as providing access to AWS technology, training, content, and community resources to prepare students for future careers.

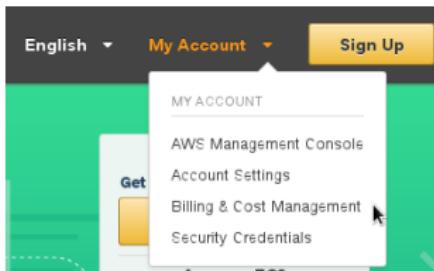

Each section includes a 'Apply for AWS Educate' button and a 'Already a Member?' link. A banner at the bottom of the page reads 'New Options to Help All Students Achieve Their Cloud Career Goals'.

- Each student which registers at the AWS gets a credit
  - The AWS credit is good for a limited time.
  - If the credit is consumed or expired and the user continues to consume resources, your credit card will be charged!

# AWS – Check your Account Activity !!!

State: October 2016

- Please regularly check their user account!
  - Login at the AWS page and check the **Billing & Cost Management** page
- Running lots of instances all the time quickly melts together your credit
  - If the credit is spent and resources are still consumed, the credit card will be charged
    - The account holder is responsible for resulting costs
  - You can specify limits and alerts ⇒ do it!

# Amazon Elastic Compute Cloud (EC2)

- Users can create, use and control virtual server instances in Amazons data centers
  - Supported operating systems: Linux and Windows Server

<u>Operating Systems</u>		
<a href="#">CentOS</a>	<a href="#">Debian</a>	<a href="#">SUSE Linux Enterprise</a>
<a href="#">Amazon Linux</a>	<a href="#">Oracle Enterprise Linux</a>	<a href="#">Ubuntu</a>
<a href="#">Red Hat Enterprise Linux</a>	<a href="#">Windows Server</a>	

- Virtual servers are created from Amazon Machine Images (AMI)
  - These are like a blueprint to be used when creating new virtual servers
  - Amazon provides prebuilt images
  - Besides Amazon, a number of third-party vendors, such as IBM, Oracle, and SAP, provide AMIs including proprietary software packages
  - End users as well can create their own images for later reuse
    - End users can publish their AMIs and put them on the market using a product ID (paid instances)

# EC2 Terminology

State: October 2016

- EC2 provides 11 sites (**regions**) with resources:
  - Virginia, California, Oregon, Ireland, Frankfurt, Singapore, Sydney, Tokyo, Seoul, Mumbai, Sao Paulo
- Each region contains **availability zones**
  - Each availability zone is a cluster

Region	Availability Zones
Virginia	us-east-1a, us-east-1b, us-east-1c, us-east-1d, us-east-1e
California	us-west-1a, us-west-1b, us-west-1c
Oregon	us-west-2a, us-west-2b, us-west-2c
Ireland	eu-west-1a, eu-west-1b, eu-west-1c
Frankfurt	eu-central-1a, eu-central-1b
Singapore	ap-southeast-1a, ap-southeast-1b
Sydney	ap-southeast-2a, ap-southeast-2b, ap-southeast-2c
Tokyo	ap-northeast-1a, ap-northeast-1b, ap-northeast-1c
Seoul	ap-northeast-2a, ap-northeast-2c
Mumbai	ap-south-1a, ap-south-1b
Sao Paulo	sa-east-1a, sa-east-1b, sa-east-1c

Update May 2018: The list of availability zones did grow: Missing in this slide are Oregon, Canada, Paris and Osaka

# EC2 Instance Types

I3 High I/O 16xlarge	i3.16xlarge	488.0 GiB	64 vCPUs	15200 GiB (8 * 1900 GiB NVMe SSD)	25 Gigabit	\$5.952000 hourly	\$4.032000 hourly	\$8.896000 hourly	\$6.976000 hourly

## EC2 - Required Steps to work with the Service (1/2)

- The user needs a **key pair** to authenticate at its instances
  - Login without password (public key method)
  - Public keys are stored inside the instances
  - Private keys are stored on the users client
  - A new key pair can be created or an existing key pair can be used
- User decides, which ports must be open
  - The fewer ports are opened, the better is the security
  - The user creates for the instance a **security group**, in which the required ports are opened
    - The user can also use an existing security group
- User decides which **operating system (AMI)** and which **instance type** meets his requirements best
- User decides which **region** and **availability zone** he prefers
- The instance is created according to the decisions made before

## EC2 - Required Steps to work with the Service (2/2)

- After the virtual server has been created, a **public** and a **private IP address** is dynamically assigned to the instance
  - With the public address the instance can be accessed from the Internet
  - With the private address it can be accessed by other instances inside the Amazon cloud
- Private and public addresses are assigned dynamically each time a new instance is created
  - Dynamically assigned addresses are not suited for the long-term operation of a server
  - Servers need to be restarted from time to time
  - Solution: **elastic IP addresses**
- Users can assign Elastic IPs – once reserved – their own server instances again and again

# Persistence of Data in EC2

- At the termination of an instance all changes are lost
- Valuable data must be stored outside the instance
  - Large amounts of structured data can be stored in S3
  - EBS provides block-based storage

AWS

# EC2 Pricing

⇒ <https://aws.amazon.com/ec2/pricing/>

- On-Demand instances
- Spot instances
  - Instances have flexible start and end times
- Reserved instances
  - Customers can rent EC2 instances over a 1 or 3 year term to reduce their total costs
- Dedicated Hosts

# EC2 Pricing: Internet Data Transfer

State: November 2017

- The import of data to AWS resources is for free
- If data is copied between AWS resources it is for free if these resources are inside the same availability zone

Data Transfer OUT From Amazon EC2 To Internet

First 1 GB / month	\$0.000 per GB
Up to 10 TB / month	\$0.090 per GB
Next 40 TB / month	\$0.085 per GB
Next 100 TB / month	\$0.070 per GB
Next 350 TB / month	\$0.050 per GB
Next 524 TB / month	Contact Us
Next 4 PB / month	Contact Us
Greater than 5 PB / month	Contact Us

# EC2 Pricing: Elastic IP und Load Balancing

State: November 2017

## • Elastic IP addresses

Region: EU (Frankfurt)

- \$0.00 for one Elastic IP address associated with a running instance
- \$0.005 per additional Elastic IP address associated with a running instance per hour on a pro rata basis
- \$0.005 per Elastic IP address not associated with a running instance per hour on a pro rata basis
- \$0.00 per Elastic IP address remap for the first 100 remaps per month
- \$0.10 per Elastic IP address remap for additional remaps over 100 per month

## • Elastic Load Balancers

**EU (Frankfurt)**

\$0.0270 per Application Load Balancer-hour (or partial hour)

\$0.008 per LCU-hour (or partial hour)

# EC2 Pricing: CloudWatch

State: November 2017

Region: EU (Frankfurt) ▾

## Amazon CloudWatch Dashboards

- \$3.00 per dashboard per month

## Detailed Monitoring for Amazon EC2 Instances

- \$2.10 down to \$0.14 per instance per month at 1-minute frequency\*\*\*\*\*

## Amazon CloudWatch Custom Metrics

- \$0.30 per metric per month for the first 10,000 metrics
- \$0.10 per metric per month for the next 240,000 metrics
- \$0.05 per metric per month for the next 750,000 metrics
- \$0.02 per metric per month for metrics over 1,000,000

## Amazon CloudWatch Alarms

- \$0.10 per alarm per month
- \$0.30 per high-resolution alarm per month

## Amazon CloudWatch API Requests

- \$0.01 per 1,000 GetMetricStatistics, ListMetrics, PutMetricData, GetDashboard, ListDashboards, PutDashboard and DeleteDashboards requests

## Amazon CloudWatch Logs\*

- \$0.63 per GB ingested\*\*
- \$0.0324 per GB archived per month\*\*\*
- Data Transfer OUT from CloudWatch Logs is priced equivalent to the "Data Transfer OUT from Amazon EC2 To" and "Data Transfer OUT from Amazon EC2 to Internet" tables on the [EC2 Pricing Page](#).

## Amazon CloudWatch Events - Custom Events\*\*\*\*

- \$1.00 per million custom events generated\*\*\*\*

# AWS Simple Monthly Calculator

 **SIMPLE MONTHLY CALCULATOR**

NEW! - Effective July 1st 2011. Free Inbound Data Transfer, Lower Outbound Data Transfer and New Tiers and Amazon EC2 running Red Hat Enterprise Linux

Choose region: US-East (Northern Vir ▾) Inbound Data Transfer is Free and Outbound Data Transfer is 1 GB free per region per month

Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides resizable compute capacity in the cloud. It is designed to make web-scale computing easier for developers. Amazon Elastic Block Store (EBS) provides persistent storage to Amazon EC2 instances.

Add To Bill Clear Form

**Compute: Amazon EC2 On-Demand Instances:**

Instances	Description	Operating System	Instance Type	Usage	Detailed Monitoring

Reset All

# EC2 – Availability

<http://aws.amazon.com/ec2-sla/>

- Amazon guarantees a monthly uptime percentage of at least 99.99%
- Maximum downtime: approximately 4 1/2 minutes per month  
⇒ 52 minutes per year

Monthly Uptime Percentage	Service Credit Percentage
Less than 99.99% but equal to or greater than 99.0%	10%
Less than 99.0%	30%

- If the guaranteed uptime percentage falls below 99.99%, the customer gets a refund
  - Will a refund of 10% or 30% help any further, if the service fails and thus the own data is not available (or gone)?

# Working with EC2

You are using the following Amazon EC2 resources in the EU West (Ireland) region:

0 Running Instances	0 Elastic IPs
0 Volumes	0 Snapshots
0 Key Pairs	0 Load Balancers
0 Placement Groups	1 Security Group

**Create Instance**

To start using Amazon EC2 you will want to launch a virtual server, known as an Amazon EC2 instance.

**Launch Instance**

Note: Your instances will launch in the EU West (Ireland) region

**Service Health**

**Service Status:**

- EU West (Ireland): This service is operating normally

**Availability Zone Status:**

- eu-west-1a: Availability zone is operating normally
- eu-west-1b: Availability zone is operating normally
- eu-west-1c: Availability zone is operating normally

# Working with the EC2 API and boto (1/2)

- Access the EC2 API the simple way via boto and Python
  - <https://github.com/boto/boto>

```
1 #!/usr/bin/env python
2
3 from boto.ec2.connection import EC2Connection
4 # Establish connection to EC2
5 # Variable "conn" points to an "EC2Connection" object
6 conn = EC2Connection('<aws access key>', '<aws secret key>')
7
8 # Receive a list of all regions and print it out
9 list_regions = conn.get_all_regions()
10 print list_regions
11
12 # Receive a list of all availability zones and print it out
13 list_zones = conn.get_all_zones()
14 print list_zones
```

## Working with the EC2 API and boto (2/2)

```
15 # Receive a list of all security groups and print it out
16 list_groups = conn.get_all_security_groups()
17 print list_groups
18
19 # Receive a list of all key pairs and print it out
20 list_keys = conn.get_all_key_pairs()
21 print list_keys
22
23 # Create instances
24 reservation = conn.run_instances('ami-e348af8a',
25                                 min_count=2,
26                                 key_name='secret',
27                                 instance_type='m1.small')
28
29 # Receive a list of all instances and print it out
30 list_instances = conn.get_all_instances()
31 print list_instances
```

# Amazon Elastic Block Store (EBS)

- EBS is a part of EC2
- Inside each availability zone, the users can create EBS volumes
  - Size: Up to 16 TB
- An EBS volume implements persistent storage
- A new EBS volume behaves just like an unformatted block device
- an EBS volume can only be mounted to one single instance
  - Volume and instance must be located in the same availability zone
- A volume can contain any filesystem
- The way of using a volume is equal to using an USB flash drive
- Note: EBS is storage for people and S3 is storage for applications
- Volume snapshots can be created (and stored in S3) any time

# Pricing of EBS

State: November 2017

Region: EU (Frankfurt)

## Amazon EBS General Purpose SSD (gp2) volumes

- \$0.119 per GB-month of provisioned storage

## Amazon EBS Provisioned IOPS SSD (io1) volumes

- \$0.149 per GB-month of provisioned storage
- \$0.078 per provisioned IOPS-month

## Amazon EBS Throughput Optimized HDD (st1) volumes

- \$0.054 per GB-month of provisioned storage

## Amazon EBS Cold HDD (sc1) volumes

- \$0.03 per GB-month of provisioned storage

## Amazon EBS Snapshots to Amazon S3

- \$0.054 per GB-month of data stored

# Working with the EBS API and boto

```
1 #!/usr/bin/env python
2
3 from boto.ec2.connection import EC2Connection
4 # Establish connection to EC2
5 # Variable "conn" points to an "EC2Connection" object
6 conn = EC2Connection('<aws access key>', '<aws secret key>')
7
8 # Create a volume (1 GB) in region "us-east-1a".
9 volume = conn.create_volume(1, 'us-east-1a')
10 # Print out the ID of the volume
11 print volume.id
12
13 # Erase volume "vol-1e0f0677"
14 conn.delete_volume('vol-1e0f0677')
```

- Attach a volume at an instance  $\Rightarrow$  `attach_volume()`
- Detach a volume from an instance  $\Rightarrow$  `detach_volume()`

# Amazon Elastic Load Balancing (ELB)

State: November 2017

- ELB is a part of EC2
- Users can create elastic load balancers inside each availability zone
- The user assigns each of its load balancers a pool of instances
- An elastic load balancer automatically distributes incoming requests to the EC2 instances of its pool
- A ELB identifies failed instances inside its pool and distributes the requests automatically to the working instances of the pool

## EU (Frankfurt)

\$0.0270 per Application Load Balancer-hour (or partial hour)

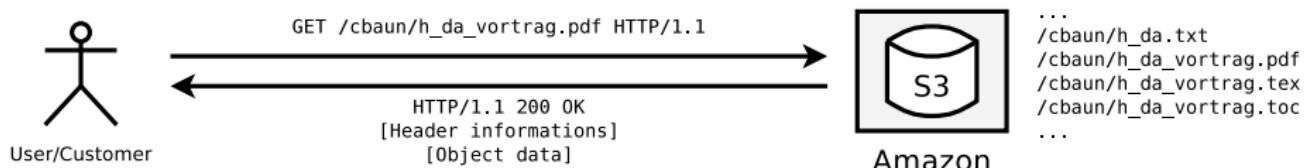

\$0.008 per LCU-hour (or partial hour)

# Amazon Simple Storage Service – S3 (1/2)

- Data is stored as **(web-)objects**
- No files or folders exist, but only **objects**
  - The size of each object can be 1 Byte to 5 TB
  - For each object, 2 KB metadata is stored
  - Each user can store an unlimited number of objects
- Each object is assigned to a **bucket**
  - Buckets have unique names and contain no other buckets  
    ⇒ Directories are impossible
  - The name of an object is also called **key**

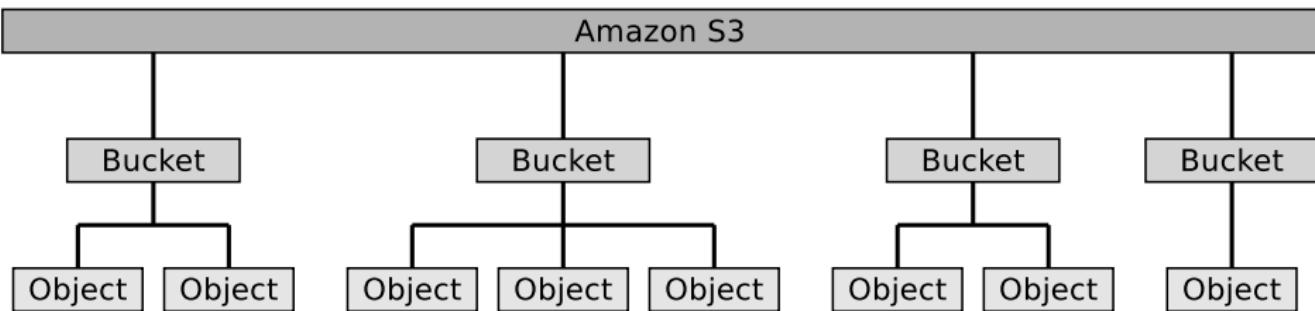

## Amazon Simple Storage Service – S3 (2/2)

- Objects are accessible online
  - `http://s3.amazonaws.com/bucket/object`
  - `http://bucket.s3.amazonaws.com/object`
- Access to buckets and objects is done via REST or SOAP (deprecated)
  - Objects can also be downloaded via BitTorrent

- Users can specify for all their objects and buckets the access privileges
  - Access Control List (ACL)

# Flat Name Space of S3

- S3 does not support folders
  - Only buckets and objects can be created
  - But folders can be simulated
    - S3Fox, Google and KOALA simulate folder by attaching `_$folder$` at the end of an objects key
    - Objects, which are assigned to such a *folder*, have a key with the naming scheme *folder/subfolder/object*

## S3 Pricing (Storage)

November 2017

Region: EU (Frankfurt)

	Standard Storage	Standard - Infrequent Access Storage †	Glacier Storage
First 50 TB / month	\$0.0245 per GB	\$0.0135 per GB	\$0.0045 per GB
Next 450 TB / month	\$0.0235 per GB	\$0.0135 per GB	\$0.0045 per GB
Over 500 TB / month	\$0.0225 per GB	\$0.0135 per GB	\$0.0045 per GB

- **Standard Storage** is designed for 99.99999999% durability and 99.99% availability of objects over a given year
  - **Reduced Redundancy Storage (RRS)** is designed to provide 99.99% durability and 99.99% availability of objects over a given year
    - This durability level corresponds to an average annual expected loss of 0.01% of the objects

## S3 Pricing (Storage)

November 2017

Region: EU (Frankfurt)

	Standard Storage	Standard - Infrequent Access Storage †	Glacier Storage
First 50 TB / month	\$0.0245 per GB	\$0.0135 per GB	\$0.0045 per GB
Next 450 TB / month	\$0.0235 per GB	\$0.0135 per GB	\$0.0045 per GB
Over 500 TB / month	\$0.0225 per GB	\$0.0135 per GB	\$0.0045 per GB

- **Glacier** is designed for 99.99999999% durability and 99.99% availability of objects over a given year
    - Extremely low-cost storage service option for data archival
    - Stores data for as little as \$0,0045 (in EU-Frankfurt) per GB per month
    - Optimized for data that is infrequently accessed and for which retrieval times of several hours are suitable

# S3 Pricing (Requests)

November 2017

## Request Pricing

Amazon S3 request costs are based on the request type, and are charged on the quantity of requests or the volume of data retrieved as listed in the table below.

Region: EU (Frankfurt) 

### Pricing

#### For Requests Not Otherwise Specified Below

PUT, COPY, POST, or LIST Requests	\$0.0054 per 1,000 requests
GET and all other Requests	\$0.0043 per 10,000 requests
Delete Requests	Free †

#### For Standard – Infrequent Access Requests

PUT, COPY, or POST Requests	\$0.01 per 1,000 requests
GET and all other Requests	\$0.01 per 10,000 requests
Lifecycle Transition Requests into Standard – Infrequent Access	\$0.01 per 1,000 requests
Data Retrievals	\$0.01 per GB

# S3 Pricing (Data Transfer)

November 2017

## Data Transfer Pricing

The pricing below is based on data transferred "in" to and "out" of Amazon S3 (over the public Internet). AWS Direct Connect pricing can be found [here](#). Transfers between S3 buckets or from S3 to any service(s) within the same region are free.

Region:	EU (Frankfurt)	Pricing
<strong>Data Transfer IN To Amazon S3</strong>		
All data transfer in		\$0.000 per GB
<strong>Data Transfer OUT From Amazon S3 To</strong>		
Another AWS Region		\$0.020 per GB
Amazon CloudFront		\$0.000 per GB
<strong>Data Transfer OUT From Amazon S3 To Internet</strong>		
First 1 GB / month		\$0.000 per GB
Up to 10 TB / month		\$0.090 per GB
Next 40 TB / month		\$0.085 per GB
Next 100 TB / month		\$0.070 per GB
Next 350 TB / month		\$0.050 per GB
Next 524 TB / month		<a href="#">Contact Us</a>
Next 4 PB / month		<a href="#">Contact Us</a>
Greater than 5 PB / month		<a href="#">Contact Us</a>

# AWS Import/Export Disk

- Helps to transfer large amounts of data into or out from the cloud

Available Internet Connection	Theoretical Min. Number of Days to Transfer 1TB at 80% Network Utilization	When to Consider AWS Import/Export Disk?
T1 (1.544Mbps)	82 days	100GB or more
10Mbps	13 days	600GB or more
T3 (44.736Mbps)	3 days	2TB or more
100Mbps	1 to 2 days	5TB or more
1000Mbps	Less than 1 day	60TB or more

- The customer sends a storage device (HDD) to Amazon
- The device content is copied by Amazon employees into a S3 bucket
  - File systems: NTFS, ext2, ext3 and FAT32 with a maximum size of 16 TB
- Pricing per storage device: \$80
- Pricing for the transfer at Amazon site per hour: \$2.49
- <https://aws.amazon.com/snowball/disk/>

# AWS Import/Export Snowball

Image Source: Amazon

- Amazon offers the Snowball Appliances for importing data into S3
- <https://aws.amazon.com/snowball/>

- Capacity: 50 TB or 80 TB
- 10 Gbit Ethernet interface
- AES 256-bit encryption
- Price: \$200 or \$250 per device for 10 days
- Each additional day costs \$15

# Similar offering – Cloud Mass Data Migration

Image Source: IBM

- IBM offers a similar import service for its own IaaS offerings
- **Cloud Mass Data Migration**
- Capacity: 120 TB
- AES 256-bit encryption
- RAID-6
- 10 Gbit Ethernet interface
- Price: \$395 per device for 10 days
- Each additional day: +\$30
- Customers can migrate 120 TB of data in seven days, with round-trip use of UPS Next Day Air included in the overall service

# AWS Snowmobile

Image Source: AWS

- Helps to transfer very large amounts of data into the cloud
  - Customers can transfer up to 100 PB per Snowmobile
    - Data is copied by Amazon employees into a S3 bucket or into Glacier
- Snowmobile is a 45-foot long shipping container, pulled by a truck
  - Includes security personnel, GPS tracking, alarm monitoring, 24/7 video surveillance, and an optional escort security vehicle while in transit
  - All data is encrypted with 256-bit encryption keys
- <https://aws.amazon.com/snowmobile/>

# Using S3 with s3cmd

- s3cmd is a simple to use command line tool for uploading, retrieving and managing data in Amazon S3
  - <http://s3tools.org/s3cmd>

**Configure login information**

s3cmd -configure

**List own buckets**

s3cmd ls

**Create bucket**

s3cmd mb s3://Bucket

**Upload object**

s3cmd put LocalFile s3://Bucket/DistantObjekt

**List content of a bucket**

s3cmd ls s3://Bucket

**Download object**

s3cmd get s3://Bucket/DistantObjekt LocalFile

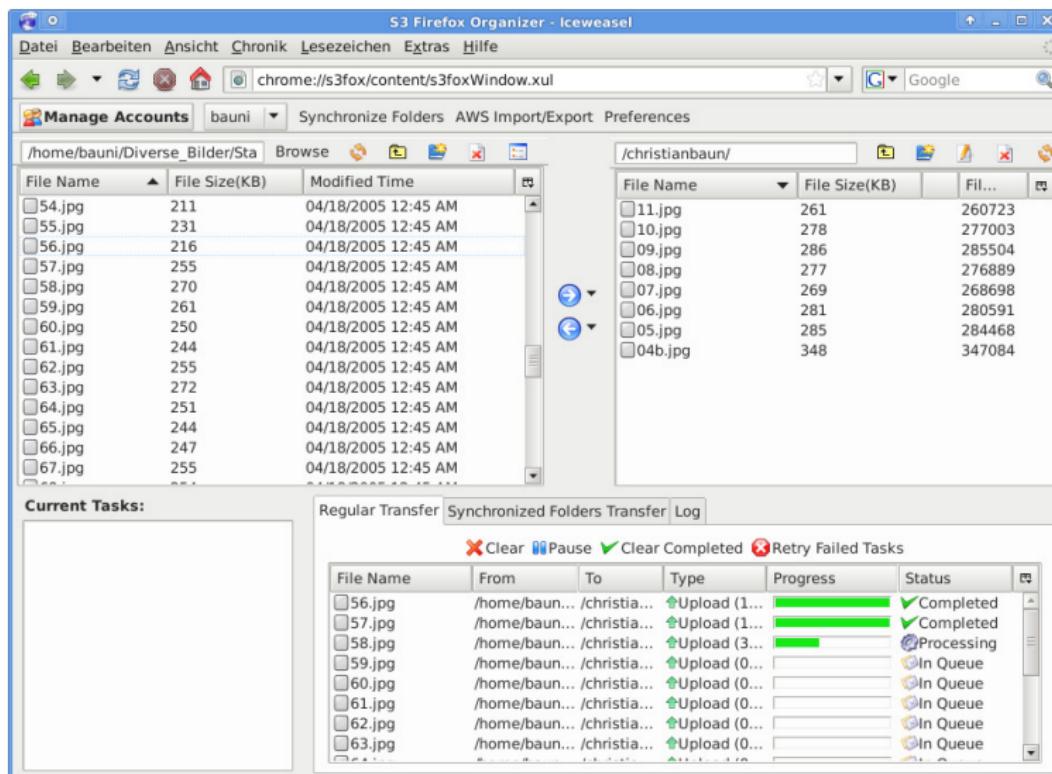

**Erase objekt**

s3cmd del s3://Bucket/DistantObjekt

**Erase (empty) bucket**

s3cmd rb s3://Bucket

# Firefox Extension S3Fox: <http://www.s3fox.net>

# Working with the S3 API and boto

```
1 #!/usr/bin/env python
2
3 from boto.s3.connection import S3Connection
4 # Establish connection to EC2
5 # Variable "conn" points to an "EC2Connection" object
6 conn = S3Connection('<aws access key>', '<aws secret key>')
7
8 # Create bucket "testbucket"
9 conn.create_bucket('testbucket')
10
11 # Retrieve a list of own buckets and print it out
12 request_buckets = conn.get_all_buckets()
13 print(request_buckets)
```

## Upload Objects via HTTP POST to S3 (1/3)

- One way to upload objects in S3, is via HTTP POST

<http://doc.s3.amazonaws.com/proposals/post.html>

[http://s3.amazonaws.com/doc/s3-example-code/post/post\\_sample.html](http://s3.amazonaws.com/doc/s3-example-code/post/post_sample.html)

- To upload a file via HTTP POST, the customer needs:
  - Access to S3
    - Access Key and Secret Access Key
  - Bucket
  - Policy document
  - Signature
  - HTML form

## Upload Objects via HTTP POST to S3 (2/3) – Policy

```
1 { "expiration": "2100-01-01T00:00:00Z",
2   "conditions": [
3     {"bucket": "<bucket>"},
4     ["starts-with", "$acl", ""],
5     {"redirect": "<DestinationAddress>"},
6     ["starts-with", "$key", ""],
7     ["starts-with", "$Content-Type", ""]
8   ]
9 }
```

- A prefix can be specified for the object name  
z.B. `["starts-with", "$key", "diagrams/"]`,
- A prefix can be specified for the content type name  
z.B. `["starts-with", "$Content-Type", "image/"]`,
- The Policy document is Base64 encoded  $\implies$  **Policy**
- The Policy is attached to the Secret Access Key and then again Base64 encoded  $\implies$  **Signature**

## Upload Objects via HTTP POST to S3 (3/3)

```
1 <form action="http://s3.amazonaws.com/<bucket>" method="post" enctype="multipart/form-data">
2   <input type="hidden" name="key" value="${filename}">
3   <input type="hidden" name="acl" value=<ACL>>
4   <input type="hidden" name="Content-Type" value=<Content Typ>>
5   <input type="hidden" name="redirect" value=<DestinationAddress>>
6   <input type="hidden" name="AWSAccessKeyId" value=<Access Key>>
7   <input type="hidden" name="policy" value=<Policy>>
8   <input type="hidden" name="signature" value=<Signature>>
9
10  <input type="file" name="file">
11  <input type="submit" name="submit" value="Upload to S3">
12 </form>
```

- Access Control List (ACL) can be: private, public-read, public-read-write or authenticated-read
- Values of the form must match the policy document
- Object successfully transmitted  $\implies$  Browser redirect to dest. address

# Some Applications and Services which use S3

- Image Hosting Service **SmugMug**

- Uses S3 since April 2006 to store images
- April 2008: SmugMug claimed to have saved almost \$1 million in storage costs because of using S3
- Calculation:

<http://don.blogs.smugmug.com/2006/11/10/amazon-s3-show-me-the-money/>

- <http://www.smugmug.com>

- Online Backup **Jungle Disk**

- <http://jungledisk.com>

- Online Backup **ElephantDrive**

- <http://elephantdrive.com>

- Online Backup **Dropbox** (until 2016)

- <http://www.dropbox.com>

- <http://www.wired.com/2016/03/epic-story-dropbox-exodus-amazon-cloud-empire/>

# More and more NAS Devices implement S3 support – HP

- Example: HP MediaSmart Server EX485
- Users can specify which data should be stored in S3 for backup

Image Source: HP

## S3 - Availability

<http://aws.amazon.com/s3-sla/>

- Amazon guarantees a monthly uptime percentage of at least 99.9%

Availability	Downtime (HH:MM:SS)		
	per Day	per Month	per Year
99.9%	00:01:26	00:43:49	08:45:56

- If the guaranteed uptime percentage falls below 99.9%, the customer gets a refund

Monthly Uptime Percentage	Service Credit Percentage
Equal to or greater than 99.0% but less than 99.9%	10%
Less than 99.0%	25%

- Will a refund of 10% or 25% help any further, if the service fails and thus the own data is not available (or gone)?
- Solution: keep data and services available in a redundant way
  - Use several public cloud offerings
  - Build up a private cloud (eventually realize a hybrid cloud)

# Google Cloud Storage

<https://cloud.google.com/storage/>

- Storage service for web objects
  - Interface is compatible with S3
  - Functionality is (almost) identical to S3
- Objects are accessible online
  - <https://storage.googleapis.com/bucket/object>
  - <https://bucket.storage.googleapis.com/object>
- Access to buckets and objects is done via REST or SOAP
- Users can specify for all their objects and buckets the access privileges
  - Access Control List (ACL)
- Provides the command line tool GSUtil and the software service (SaaS) Google Storage Manager
  - GSUtil can interact with Google Cloud Storage and S3
    - GSUtil is based on the Python library boto

# Some further S3-compatible Service Offerings
